Research Interests

I study strongly correlated electron systems, with a current emphasis on frustrated magnetism, chiral magnetism, and heavy transition metal magnetism. I study these magnetic materials primarily with neutron scattering, but I also perform muon spin rotation/relaxation (μ SR), synchrotron x-ray experiments, and high magnetic field bulk characterization measurements in select cases when these other techniques can provide additional insight into a particular material. Finally, I have maintained an interest in synthesizing polycrystalline samples and single crystals of new materials and characterizing them via magnetometry, heat capacity, resistivity, and X-ray diffraction measurements.
